

MCT: MODULE TITLE-I

Introduction to Information Systems

The contents of these
eLearning materials are
EXCLUSIVELY for BPC
use only.

 Bachelor of Science in Information Systems IS-ISP 323 Information Systems Planning	Bulacan Polytechnic College	Date Developed: February 2021 Date Revised:	Page 1 of 5
	Document No. 10-IS-ISP 323	Developed by: Mauro C. Tolentino	Revision # 02

MODULE CONTENT

COURSE TITLE: INFORMATION SYSTEMS PLANNING

MODULE TITLE Introduction to Information Systems

NOMINAL DURATION: 6 HRS (No. of hours per topic)

SPECIFIC LEARNING OBJECTIVES:

At the end of this course the student **MUST** be able to:

1. Define and explain Information System and its components,
2. Identify the system approach to Information System;
3. Discuss the various benefits of Information System to Organizations;
4. Identify the uses and applications of Information Systems;
5. Identify and discuss the role of technology in business.

TOPICS OF DISCUSSION COVERAGE:

1. Information System and its components
2. The Information System approach
3. Benefits of Information System to an organization
4. Applications of Information System
5. Role and opportunities in technology.

ASSESSMENT METHOD/S:

- Written Quizzes and Assignments on PDF sent through FB Messaging or email
- Oral recitation or Demonstrative Exercises via Google Meet

Information Sheet IS-ISP 323-1
Introduction to Information Systems

IS-318.1.1 Approach towards Information System

Current approaches to information systems (IS) are roughly based on technical, scientific, or formal aspects which miss the human nature of IS or, otherwise in organizational and social aspects highlighting the human but missing concrete implementations. This results too often in IS failures. We think the problem relies on an inadequate paradigm (standard, model) to deal with the human element and we propose a new philosophical stance – human relativism (belief)– to overcome the problems felt. This new approach will lead to a new way of developing IS that will be human-centered. In this sense, we propose also as a possible way to apply this new paradigm a human action-oriented perspective that could be used for information systems development. Therefore, human-action is analyzed as well and a comprehensive multi-dimensional holistic view (universal, complete) of it is given, followed by a particular choice of a selected group of dimensions suggested to be used in information system development according to human relativism.

Introduction

Within the competitive global environment, information has become a key resource for increasing a corporation's competitiveness by changing the nature or conduct of business. Accordingly, corporations are now seeking a method for information systems planning to maximize their strategic effectiveness.

Strategic Information Systems Planning (SISP) refers to the process of creating a portfolio for the implementation and use of IS to maximize the effectiveness and efficiency of a corporation so that it can achieve its objectives.

IS-318.1.2 The role of Information System in an Organization

What Is an Information System?

At the most basic level, an information system (IS) is a set of components that work together to manage data processing and storage. Its role is to support the key aspects of running an organization, such as communication, record-keeping, decision making, data analysis, and more. Companies use this information to improve their business operations, make strategic decisions and gain a competitive edge.

Information systems typically include a combination of software, hardware, and telecommunication networks. For example, an organization may use customer relationship management systems to gain a better understanding of its target audience, acquire new customers and retain existing clients. This technology allows companies to gather and analyze sales activity data, define the exact target group of a marketing campaign, and measure customer satisfaction.

The Benefits of Information Systems

Modern technology can significantly boost your company's performance and productivity. Information systems are no exception. Organizations worldwide rely on them to research and develop new ways to generate revenue, engage customers and streamline time-consuming tasks.

 Bachelor of Science in Information Systems IS-ISP 323 Information Systems Planning	Bulacan Polytechnic College	Date Developed: February 2021 Date Revised:	Page 3 of 5
	Document No. 10-IS-ISP 323	Developed by: Mauro C. Tolentino	Revision # 02

With an information system, businesses can save time and money while making smarter decisions. A company's internal departments, such as marketing and sales, can communicate better and share information more easily.

Since this technology is automated and uses complex algorithms, it reduces human error. Furthermore, employees can focus on the core aspects of a business rather than spending hours collecting data, filling out paperwork, and doing manual analysis.

Uses and Applications

There are different types of information systems and each has a different role. Business intelligence (BI) systems, for instance, can turn data into valuable insights.

This kind of technology allows for faster, more accurate reporting, better business decisions, and more efficient resource allocation. Another major benefit is data visualization, which enables analysts to interpret large amounts of information, predict future events, and find patterns in historical data.

Organizations can also use enterprise resource planning (ERP) software to collect, manage and analyze data across different areas, from manufacturing to finance and accounting. This type of information system consists of multiple applications that provide a 360-degree view of business operations. NetSuite ERP, PeopleSoft, Odoo, and Intacct are just a few examples of ERP software.

IS-318.1.3 Opportunities in Technology

How Does Technology Improve Customer Service?

Improved customer service and new technology go hand in hand. However, using technology doesn't mean that your business no longer needs personable customer service representatives to nurture customer relationships. That kind of one-on-one relationship is more important than ever, and technology can help to make it *more* effective.

How Technology Has Changed the Business Environment

Businesses are constantly under pressure to keep up with ever-changing technological advancements. While smartphones allow business communications to occur from virtually anywhere, social media is enabling marketers to directly reach their target audience on a whole new level. Several major technological changes have had significant impacts on the present and future for businesses.

Types of Technology in a Business Environment

What Are the Benefits of Technology in Business?

The way that businesses function both in and out of the office has changed drastically thanks to advances in computer, information, and communication technology. Companies now use a variety of mobile devices, software, and various applications that employees can use for marketing and networking, as well as research and development, for their goods and services.

Internet

The Internet, perhaps more than any other factor, has changed the way that companies do business. Most companies have websites, which allow them to reach a much larger audience and attract customers and employees from all over the world. In addition, businesses are now utilizing social networking websites such as Facebook, LinkedIn, and Twitter, enabling them to communicate directly with customers with news and updates. These websites are interactive, which means that companies can also receive immediate feedback on new products from customers, speeding the process of research and development. Email, video conferencing and online chat rooms have also made it easier for businesses to become more globalized, communicating quickly and easily with clients and co-workers regardless of their location.

Mobile Devices

The Internet resources listed above are not just available on an office computer. Many companies provide their employees with other mobile devices such as laptops, tablet computers, PDAs, and smartphones. These devices are portable and enable workers to stay constantly connected and updated with their work. They also make it more possible for employees to have a "mobile office," working from any location and allowing them to travel or live in an area other than where the business is located. Most mobile devices also have an enormous number of applications available such as productivity tools, locators that utilize GPS functions, and other organizational applications that help employees download, type, share and even print documents remotely from their device.

Software

Depending on the type of business, the software used by companies will vary. However, many companies can benefit from several types of software and applications. For example, Voice Over Internet Protocol (VoIP) software, when installed, allows businesses to make phone calls and have conferences over the Internet rather than use the traditional analog signal. Most business software is designed to make specific tasks, such as budgeting, accounting, and communication, easier, faster, and more cost-effective. They also help with more advanced tasks, such as translation for companies that are moving into the global marketplace, website design, and monitoring and managing of web services.
